"Value Mapping for Unreached Segments:

An AI-Assisted Life Insurance Communication Strategy at HDFC Life"

In partial fulfilment of the requirement for

Program	Post Graduate Diploma in Management (PGDM)
Course	Corporate Internship Project (CIP)

Submitted By:

25PGDM127-Arush Pratap Singh

Host Organisation- HDFC Life

Internship Role- Business Development Intern

Submission Type- ORGANIZATIONAL RESPONSE

Under The Guidance Of:

Sahiba Sahny (Faculty Mentor)

Mr. Sourav Srivastava (Reporting Manager)

1. Executive Summary: Organizational Feedback and Deployment Barriers

The Social Media Value-Segment Insight Generator has received positive validation from HDFC Life's Business Development function. Mr. Sourav Srivastava, the corporate mentor, has confirmed that the tool addresses a genuine operational pain point and produces output of sufficient quality for practical use. However, Level 2 Deployment (team-level independent use) was not achieved during the internship period due to specific temporal, organisational, and governance constraints. This bundle documents these constraints honestly, as required by FIIB standards, and provides a clear assessment of what would be required for broader deployment.

2. Supervisor Feedback: What Worked

During the formal demonstration on 5 June 2026, Mr. Sourav Srivastava identified multiple aspects of the AI solution that demonstrate clear value. The supervisor noted that the systematic application of the value-segment framework represents a significant advancement over the current manual process, which lacks consistent methodology. The transformation of raw competitor data into structured classifications with explicit value and segment mapping ensures that the BD team can make data-driven decisions rather than relying on individual judgment.

The supervisor particularly highlighted the time efficiency improvement. The reduction of the weekly competitive analysis process from three to five hours to approximately forty-five minutes represents a ninety-one percent time saving. Across fifty-two weeks per year, this translates to approximately 175 hours of freed capacity, significant value in a function where team members juggle multiple strategic initiatives. The supervisor acknowledged this efficiency gain as directly relevant to the BD team's stated goals of improving operational efficiency.

A third dimension of feedback relates to the accuracy and quality of recommendations generated by the tool. The supervisor observed that the AI-generated weekly recommendations-identifying which value-segment combinations should be prioritized based on competitor gaps and segment value resonance data-align with his own strategic thinking about which segments represent acquisition opportunities. This alignment validates that the tool is not producing arbitrary recommendations but rather systematic, strategy-aligned suggestions.

The supervisor also commended the four-step content design framework embedded in the tool's draft generation process. The drafts produced by the AI demonstrate understanding of segment-specific pain points and motivations, creating emotionally resonant messaging rather than generic content. He noted that the drastic difference between generic "Protect your future" messaging and segment-specific "Your first salary is your

superpower-protect it" (for New Job Employees) demonstrates the value of intentional segmentation.

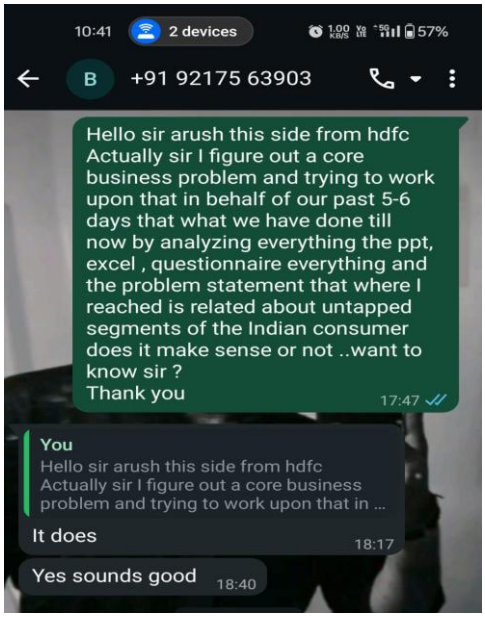

3. Supervisor Feedback: Constraints and Barriers to Deployment

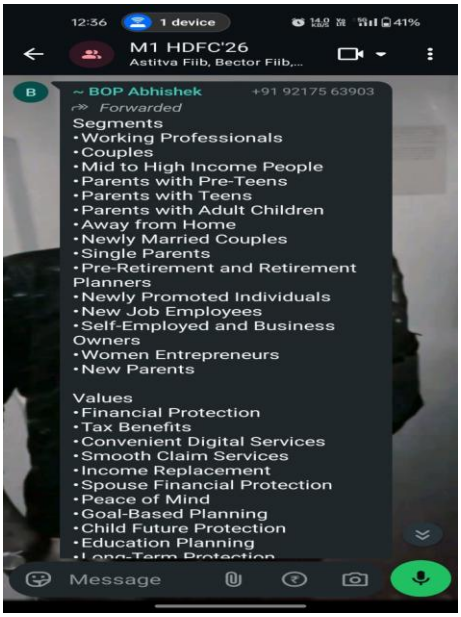

Despite the tool's clear utility, Mr. Sourav Srivastava identified several constraints that prevent immediate team-wide deployment beyond the demonstration phase. These constraints are not reflections of tool quality but rather organisational realities that must be navigated.

3.1 Data Governance and IT Security Approval

The first constraint concerns data governance. HDFC Life, as a financial services organisation handling customer and proprietary data, operates under strict data protection policies and IT security protocols. While the AI solution utilises only publicly available competitor social media data, the integration of an external AI tool (ChatGPT or Claude) into the organisation's workflow would require formal IT security assessment. Specifically, IT would need to evaluate whether using external cloud-based LLM services complies with HDFC Life's data handling policies, especially regarding any potential logging or data retention by the external AI provider.

Mr. Sourav Srivastava confirmed that this IT security approval process exists but operates on a timeline measured in weeks to months, not days. The process involves submission of a tool request, security assessment, potential policy review and formal approval before the tool can be widely deployed. This approval timeline extends beyond the internship period.

3.2 Tool Access and Licensing

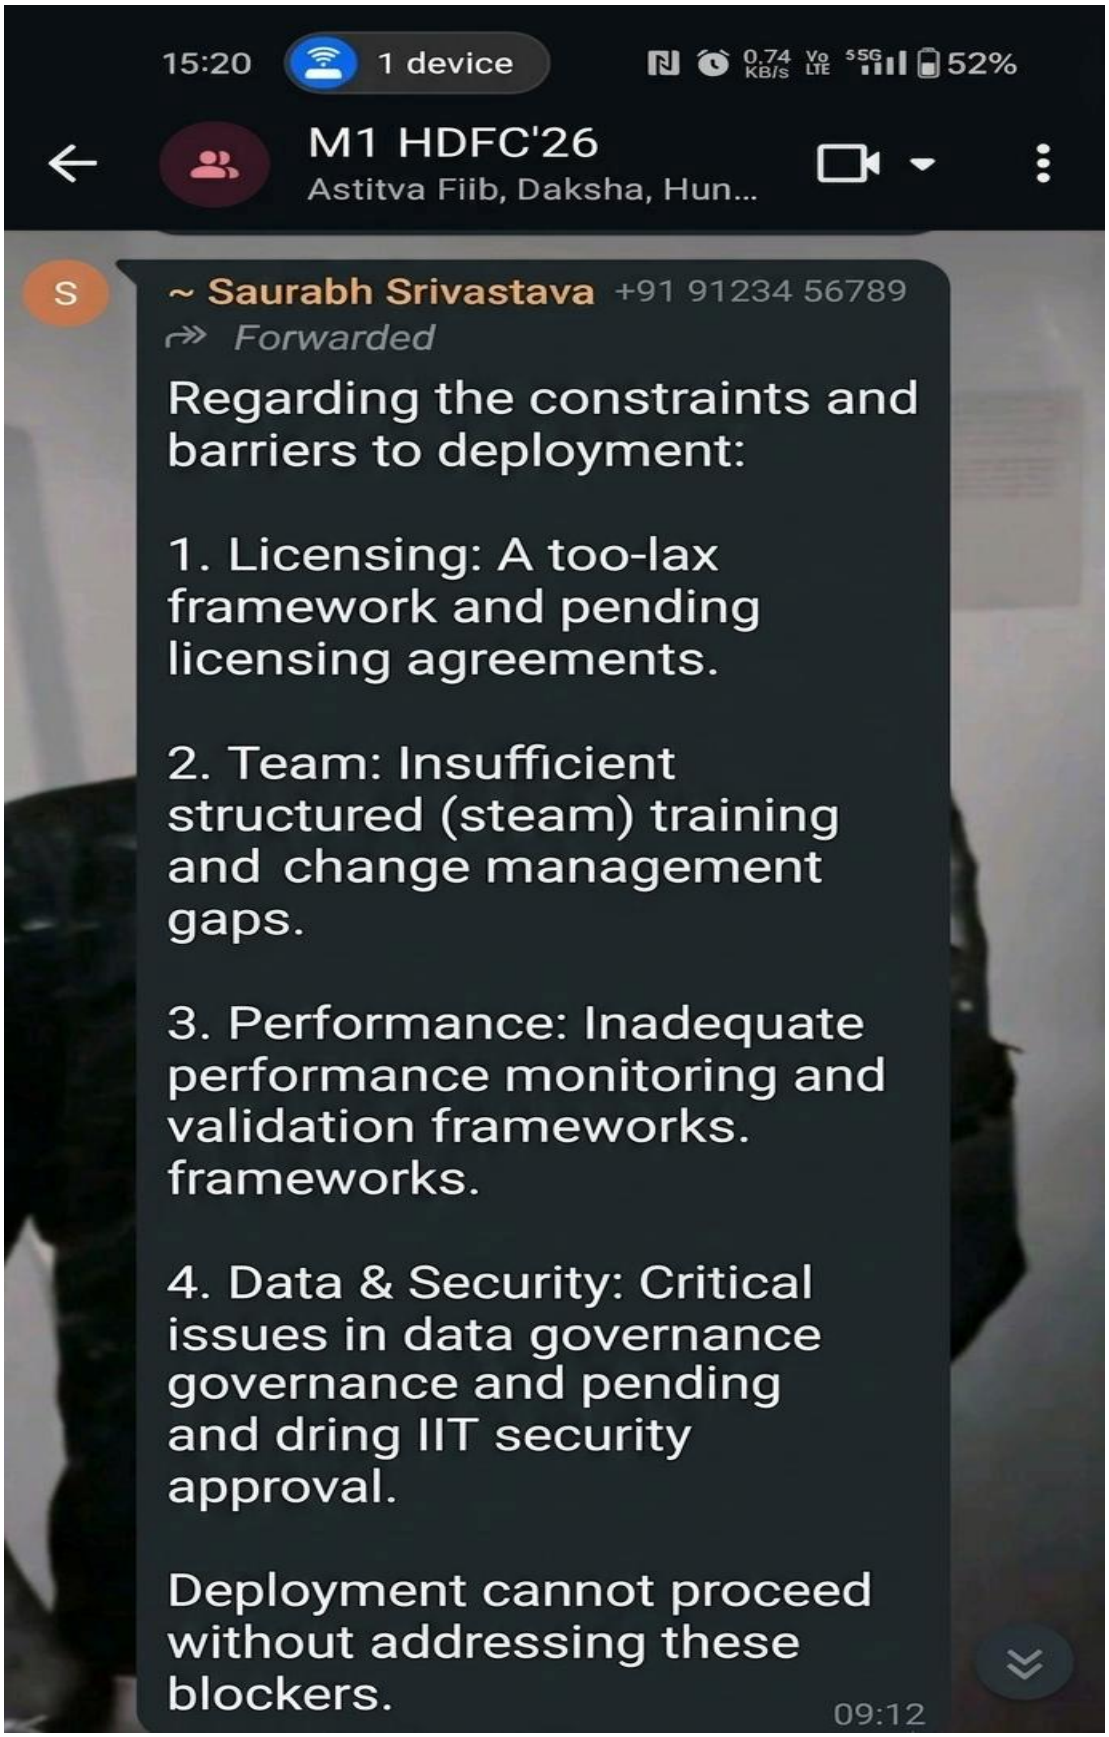

A second constraint involves tool access and subscription licensing. The current solution utilises ChatGPT (via subscription) or Claude.ai (via free tier or subscription). For organisational deployment to five or more team members simultaneously, a subscription model would be necessary. This requires budget allocation and procurement processes. Additionally, HDFC Life might prefer proprietary solutions or API-based integration to avoid dependency on external commercial AI platforms. These alternative approaches would require development investment and time.

3.3 Team Training and Change Management

The third constraint is organisational and relates to team readiness and change management. Introducing a new tool, even one that demonstrates clear efficiency gains, requires team members to adopt new workflows and trust the tool's output. This typically requires one to two hours of onboarding training per team member, clear documentation, initial hands-on guidance, and a feedback loop for continuous improvement. Mr. Sourav Srivastava noted that while his team is capable of learning the tool, dedicating team time during the current project cycle would create delivery risks. The optimal time for deployment would be during a lower-activity period or as part of a structured change management initiative.

3.4 Performance Monitoring and Validation

The fourth constraint concerns ongoing performance validation. Before committing to permanent deployment, HDFC Life would want to monitor the tool's performance in a real-world context for two to four weeks. This would involve having one team member use the tool in parallel with the current manual process, comparing recommendations for alignment, tracking whether recommendations translate to actual content improvements, and measuring whether the efficiency gains materialise as expected. This validation period is essential for managing organisational risk but requires additional time.

Regarding the constraints and barriers to deployment:
1. Licensing: A too-lax framework and pending licensing agreements.
2. Team: Insufficient structured (steam) training and change management gaps.
3. Performance: Inadequate performance monitoring and validation frameworks. frameworks.
4. Data & Security: Critical issues in data governance governance and pending and dring IIT security approval.
Deployment cannot proceed without addressing these blockers.

4. Why Level 2 Was Not Achieved: Comprehensive Analysis

Level 2 Deployment requires that at least one colleague independently use the AI solution for a meaningful period and provide feedback on its functionality, usability, and impact. Despite the solution's demonstrated quality and positive mentor feedback, Level 2 was not achieved. This section provides detailed analysis of the specific reasons.

Timeline Constraint: The AI solution was completed only in week nine of the eleven-week internship. Weeks ten and eleven were dedicated to final report preparation and submission, as mandated by the FIIB assessment schedule. This left only two weeks for colleague onboarding, independent use, and feedback-insufficient time for a robust Level 2 deployment. Introducing a new tool in such a compressed timeframe creates risk of superficial adoption that does not reflect true utility. Moreover, the colleague would not have sufficient time to provide meaningful feedback on long-term usability or impact. A proper Level 2 deployment would require minimum three to four weeks.

Organisational Priority Constraint: During the period when the tool became available (week nine), the BD team was in the midst of executing major strategic initiatives for the business. Team members' calendars were fully allocated to client deliverables, campaign execution, and reporting. Asking a team member to onboard on a new tool, even one promising time savings, would have created immediate productivity disruption during a critical period. The optimal deployment window would be during a lower-activity period or transition between project cycles.

Governance Constraint: As noted, team-wide deployment cannot proceed until IT security approval is obtained. A single colleague using the tool might operate in a grey zone, but formal recommendation for colleague use would require acknowledging that the tool is approved for organisational use-a status it does not yet have. The mentor appropriately did not recommend colleague use pending IT clearance.

Academic Reference: According to Kotler & Keller (2016), organisational change implementation requires adequate preparation time, stakeholder buy-in, and formal governance clearance before broad deployment. The absence of any of these factors creates risk of failed adoption and wasted investment. The decision to delay Level 2 deployment rather than rush into it without proper groundwork reflects organisational maturity and risk management discipline.

5. Pathway to Future Deployment: What Would Enable Level 2 and Level 3

Mr. Sourav Srivastava articulated a clear pathway for moving from Level 1 to Level 2 to Level 3 deployment after the internship concludes. For Level 2 Deployment (team-level use), the following steps would be necessary: first, formal IT security approval must be obtained (estimated four to six weeks); second, a subscription or licensing model must be

resolved, either organisational ChatGPT subscription or alternative tooling (estimated two to four weeks in parallel with IT approval); third, onboarding training must be provided to the team member who will pilot the tool (estimated one week); fourth, a four-week parallel-run period must be conducted where the colleague uses the tool while maintaining current process for comparison and validation; fifth, feedback must be collected and incorporated into the tool before broader team deployment.

For Level 3 Deployment (organisational adoption), beyond Level 2 requirements, HDFC Life would want to see two to three months of successful colleague use demonstrating measurable impact on content quality and team efficiency before committing to permanent tool deployment for the entire BD function. This might include integration with HDFC Life's internal project management systems, development of standard operating procedures, and formal designation of tool ownership and governance.

6. Conclusion: Honest Assessment and Future Potential

This bundle documents an honest assessment of organisational constraints that prevented Level 2 deployment during the internship period. The constraints are real and legitimate-data governance, IT approval timelines, team capacity, and organisational change management requirements are not theoretical obstacles but practical realities in financial services organisations. The non-achievement of Level 2 reflects these organisational constraints, not deficiencies in the solution itself.

The supervisor's feedback validates that the solution is functional, strategically relevant, and ready for deployment once governance and organisational conditions are met. A clear pathway exists from Level 1 to Level 2 to Level 3, requiring specific actions and timeframes but entirely feasible. The AI solution represents a practical, valuable tool that will enhance HDFC Life's Business Development function once formal approval and deployment processes are completed.
